In general, when converting from base units (m, l, g, etc) or derived units (m^2 , m^3 , m/s, Hz, N, J, V, etc) to a multiple greater (kilo, mega, giga, or tera) than the base or derived unit- then divide by the factor. For example: $10m = 10/1000km = 1/100 km = .01km$.

When converting from base units or derived units to a multiple smaller (centi, milli, micro, nano) than the base or derived unit- then multiply by the factor. For example: 10m = 10 x 100cm = 1000cm.
